

Hi.

I think you missed creating the file during the creation of your Vidly application.

I have links below to articles that might point you in the right direction.

[Create Identity In Simple Ways Using ASP.NET MVC 5](#)

[How to auto generate IdentityModels.cs](#)

[How To Customize Identity In ASP.NET MVC 5](#)

One of your classmates gave what seems to be very helpful answer. I didn't need the tips this student gives because I used Visual Studio 2013, but I share with you so the ideas might point you in the right direction. I think the student comments relate to using VS 2019.

Answer to the Identity Model Question

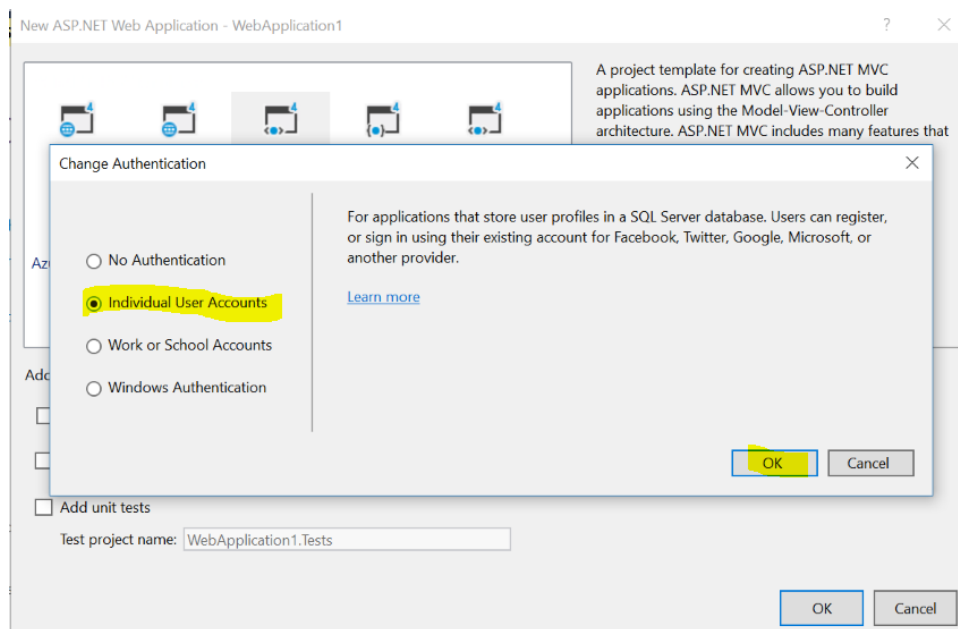

In case somebody wants to know why they don't see the IdentityModel.cs etc files under the Models folder, you need to change authentication while creating the project. By default, the Authentication is set to "No Authentication". Please change it to "Individual User Accounts" while creating the project. Steps are as follows:

File > New > Project > ASP.NET Web Application (.Net Framework)

Click the Change Authentication button:

Then select the Individual User Accounts option:

**More details on the following link for those who already have a project:**
